Introduction

The influence of mass

Horizon-AGN Dubois+14

Fact 1: Galaxies are greedy

Galactic properties are driven by galactic mass

Who said “Cosmic Web”?

Who said “Cosmic Web”?

Fact 2: Galaxies are social beings

Galactic properties are driven by the local density

OK... but you also said “Assembly Bias”?

A central galaxy – M87, Virgo Cluster, ESO

A less central galaxy – M101, HST

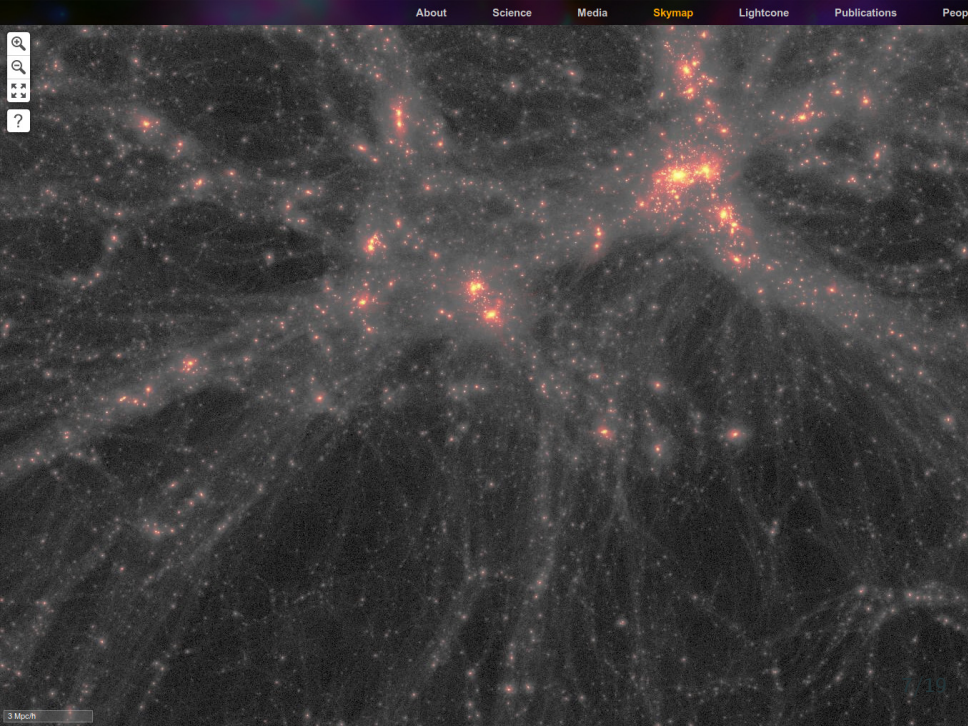

Different **environments** → different **morphological distribution**

Fact 3: Galaxies have different social backgrounds

Galactic properties are influenced by the large-scale structure

Fact 4: Galaxies DM halo

Galactic properties are correlated with DM halos'

We've seen that galactic properties are influenced by

1. their mass
2. their local density
3. their large-scale environment?

We've seen that galactic properties are influenced by

1. their mass ✓
2. their local density
3. their large-scale environment?

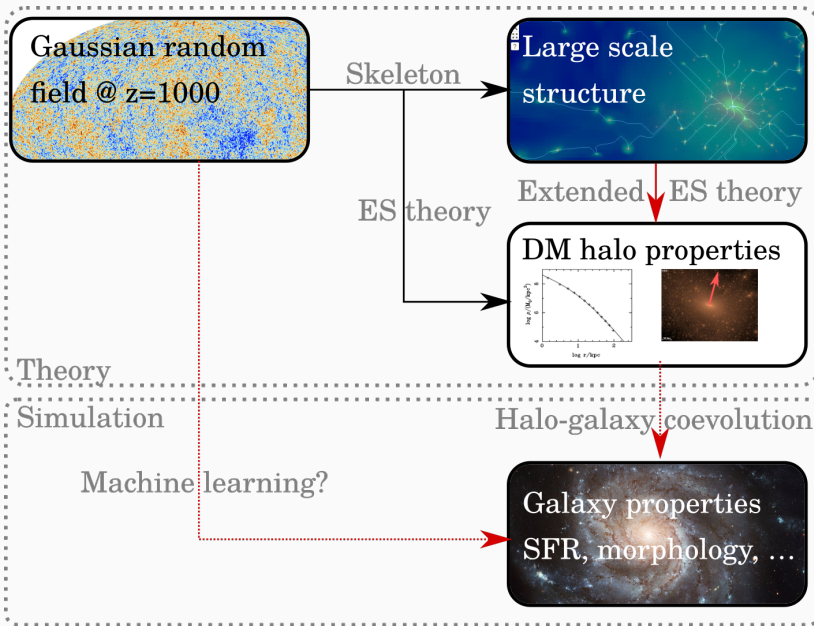

We've seen that galactic properties are influenced by

1. their mass ✓
2. their local density ✓
3. their large-scale environment?

We've seen that galactic properties are influenced by

1. their mass ✓
2. their local density ✓
3. their large-scale environment? To what extent? Can we quantity it?

What's the plan?

Effect on assembly history

Typical mass

$$\Delta M_{\star}(\mathbf{r}) \propto \delta_S \xi_{20}(\mathbf{r}) \mathcal{Q}$$

ξ_{20} : corr. density-tide +
density

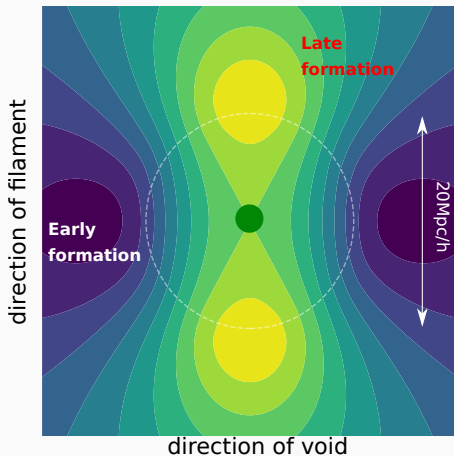

Accretion rate $\dot{Q} \approx 3 \times 10^{11} M_{\odot}$ & $z = 0$

$$\Delta \dot{M}(\mathbf{r}) \propto \left[\xi'_{20} - \frac{\sigma - \xi'_1 \xi_1}{\sigma^2 - \xi_2^2} \xi_{20} \right] \mathcal{Q}$$

ξ'_{20} : corr. slope-tide +
variance of field

Formation time @ $\approx 3 \times 10^{11} M_{\odot}$ & $z = 0$

$$\Delta z_{\star}(\mathbf{r}) \propto M \xi_{20}(\mathbf{r}) Q$$

higher mass: later
formation time

Tension with observations?

Theory

Predict higher + late formation:
blue central galaxy?

Observations

Massive red central galaxies

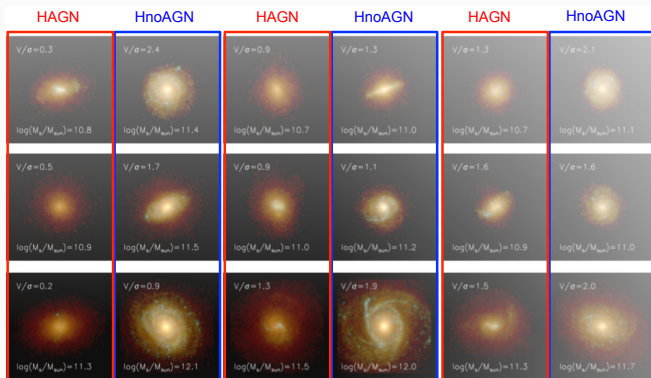

Tension with observations?

Theory

Predict higher + late formation:
blue central galaxy?

Observations

Massive red central galaxies

Dubois+16

Gradient alignment

- background: ρ
- dotted M
- dashed \dot{M}

K. Kraljic, S. Arnouts, C. Pichon, C. Laigle, S. de la Torre, D. Vibert, C. Cadiou et al., MNRAS

Gradient alignment

- background: ρ
 - dotted M
 - dashed \dot{M}
- \Rightarrow different gradients

K. Kraljic, S. Arnouts, C. Pichon, C. Laigle, S. de la Torre, D. Vibert, C. Cadiou et al., MNRAS

(Temporary) conclusions

Halos in nodes ...

- form later,
- are accreting more,
- typically more massive,

compared to those in filaments (and same from voids to filaments).

In agreement with results from n-body simulations + hint for different assembly w.r.t. cosmic web.

Quantitative results

Voids to filaments

- $M \times 10^2$
- $\dot{M}/M + 30\%$
- $z_f - 15\%$

Filaments to nodes

- $M \times 6$
- $\dot{M}/M + 10\%$
- $z_f - 5\%$

Conclusion

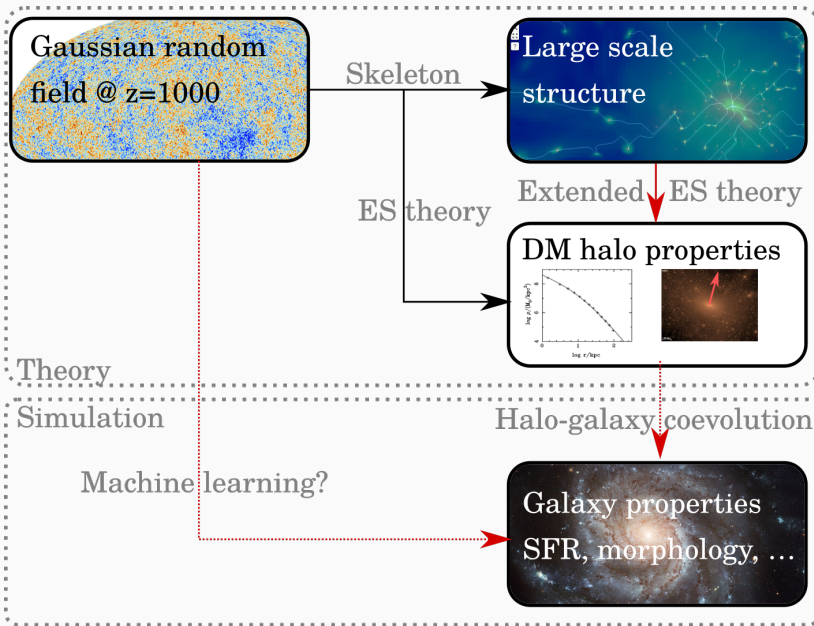

Results

- Different gradients for different quantities
 - Effects beyond mass & local density
 - DM halo in nodes (resp. filaments)
 - form later
 - accrete more
 - are more massive
- than in filaments (resp. voids)

Open questions / WIP

- Link DM halo to galaxy
- Take into account non-spherical collapse
- Build more proxies (e.g. merger rate)?

What's the plan?

Thank you!

Effect of large scale

ξ functions

$$\xi_{00} \propto \langle \delta \delta_S \rangle$$

$$\xi'_{00} \propto \langle \delta' \delta_S \rangle$$

$$\xi_{11} \propto \langle \delta g_i \rangle$$

$$\xi'_{11} \propto \langle \delta' g_i \rangle$$

$$\xi_{20} \propto \langle \delta \bar{q}_{ij} \rangle$$

$$\xi'_{20} \propto \langle \delta' \bar{q}_{ij} \rangle$$
