Outline

Introduction

Different methods

- Velocity method

- Monte Carlo method

MC Implementation

Is it working?

Discussion

Introduction

Eulerian code (AMR like):

- no subgrid information
- no Lagrangian history of gas

Is it possible to overcome this issue?

From passive scalar to tracers

- Where does the gas come from?

From passive scalar to tracers

- Where does the gas go?
- Where does the gas come from?

From passive scalar to tracers

- Where does the gas go?
- Where does the gas come from?
- How much gas is recycled in stars? in AGNs?

From passive scalar to tracers

- Where does the gas go?
- Where does the gas come from?
- How much gas is recycled in stars? in AGNs?
- ... [TBC]

What's a tracer

What are the properties we want for tracers?

What's a tracer

What are the properties we want for tracers?

Physical properties

- Passive
- *Behave* like the gas on average
- Like individual H/He nuclei

What are the properties we want for tracers?

Physical properties

- Passive
- *Behave* like the gas on average
- Like individual H/He nuclei

Computational properties

- Cheap (CPU? RAM?)
- Go where the gas goes (star, sinks, grid, dust, ...)

Different methods

Velocity method

Move tracers using tri-linear interpolation of the velocity

$$v_i^p = \text{interpolation} \sum_{\text{neighbor } j} v_j \quad (1)$$

Pros

- smooth Lagrangian history (trace velocity)
- already implemented in RAMSES!

Velocity method

Move tracers using tri-linear interpolation of the velocity

$$v_i^p = \text{interpolation} \sum_{\text{neighbor } j} v_j \quad (1)$$

Pros

- smooth Lagrangian history (trace velocity)
- already implemented in RAMSES!

Cons

- *does not* follow the gas density: $\int dS v_i^p \rho \neq \text{flux}$
- how to trace stars? AGN?
- quite CPU expensive

Monte Carlo method

Move tracers following flux

$$p_{i \rightarrow j} = \frac{\text{mass flux}_{i \rightarrow j}}{M_i}$$

Monte Carlo method

Move tracers following flux

$$p_{i \rightarrow j} = \frac{\text{mass flux}_{i \rightarrow j}}{M_i}$$

Pros

- CPU cheap
- follow gas density
- precision $\propto N_{\text{tracers}}$
- move onto stars, sinks, ...

Monte Carlo method

Move tracers following flux

$$p_{i \rightarrow j} = \frac{\text{mass flux}_{i \rightarrow j}}{M_i}$$

Pros

- CPU cheap
- follow gas density
- precision $\propto N_{\text{tracers}}$
- move onto stars, sinks, ...
- **now implemented!**

Monte Carlo method

Move tracers following flux

$$p_{i \rightarrow j} = \frac{\text{mass flux}_{i \rightarrow j}}{M_i}$$

Pros

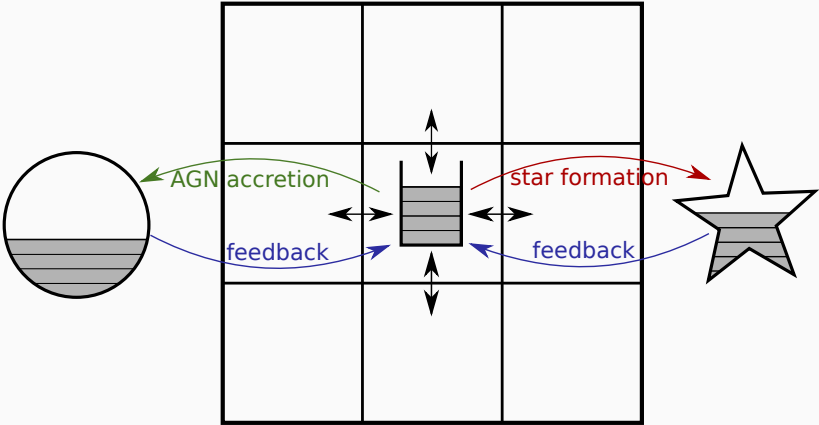

- CPU cheap
- follow gas density
- precision $\propto N_{\text{tracers}}$
- move onto stars, sinks, ...
- **now implemented!**

Cons

- RAM expensive
- noisy Lagrangian history

MC Implementation

Scheme

First and last equations: Let

$$M_{i,\text{out}} = \sum_{j \wedge i} M_{i \rightarrow j} \quad \text{if } M_{i \rightarrow j} > 0,$$

then **for all tracer particles** in cell i :

$$p_{i,\text{out}} = \frac{M_{i,\text{out}}}{M_i}, \quad \# \text{ Proba. of going out of } i \quad (2)$$

$$p_{i \rightarrow j} = \frac{M_{i \rightarrow j}}{M_{i,\text{out}}}, \quad \# \text{ Proba. of going from } i \text{ to } j \quad (3)$$

following *S.Genel et al, 13*

Algorithm

Algorithm for cell i mass M_i , neighbors j :

1. Compute outgoing mass $M_{i,\text{out}}$ and $M_{i \rightarrow j}$.

Algorithm

Algorithm for cell i mass M_i , neighbors j :

1. Compute outgoing mass $M_{i,\text{out}}$ and $M_{i \rightarrow j}$.
2. Compute outgoing proba $p_{i,\text{out}} = M_{i,\text{out}}/M_i$ and $p_{i \rightarrow j} = M_{i \rightarrow j}/M_{i,\text{out}}$.

Algorithm

Algorithm for cell i mass M_i , neighbors j :

1. Compute outgoing mass $M_{i,\text{out}}$ and $M_{i \rightarrow j}$.
2. Compute outgoing proba $p_{i,\text{out}} = M_{i,\text{out}}/M_i$ and $p_{i \rightarrow j} = M_{i \rightarrow j}/M_{i,\text{out}}$.
3. For each particle:
 - 3.1 Draw random number r_j .
 - 3.2 Select particles $r_j < p_{i,\text{out}}$.

Algorithm for cell i mass M_i , neighbors j :

1. Compute outgoing mass $M_{i,\text{out}}$ and $M_{i \rightarrow j}$.
2. Compute outgoing proba $p_{i,\text{out}} = M_{i,\text{out}}/M_i$ and $p_{i \rightarrow j} = M_{i \rightarrow j}/M_{i,\text{out}}$.
3. For each particle:
 - 3.1 Draw random number r_j .
 - 3.2 Select particles $r_j < p_{i,\text{out}}$.
4. For each selected particle:
 - 4.1 Draw random number r'_j .
 - 4.2 If $r'_j < p_{i \rightarrow j}$, move to cell j .

Algorithm

Algorithm for cell i mass M_i , neighbors j :

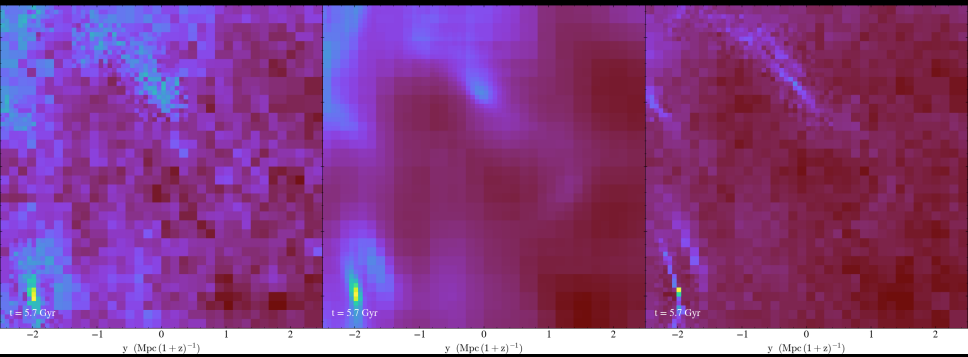

1. Compute outgoing mass $M_{i,\text{out}}$ and $M_{i \rightarrow j}$.
2. Compute outgoing proba $p_{i,\text{out}} = M_{i,\text{out}}/M_i$ and $p_{i \rightarrow j} = M_{i \rightarrow j}/M_{i,\text{out}}$.
3. For each particle:
 - 3.1 Draw random number r_j .
 - 3.2 Select particles $r_j < p_{i,\text{out}}$.
4. For each selected particle:
 - 4.1 Draw random number r'_j .
 - 4.2 If $r'_j < p_{i \rightarrow j}$, move to cell j .

Small flux limit: $N_{\text{moved}} \sim \text{Poisson distribution}(p)$

Is it working?

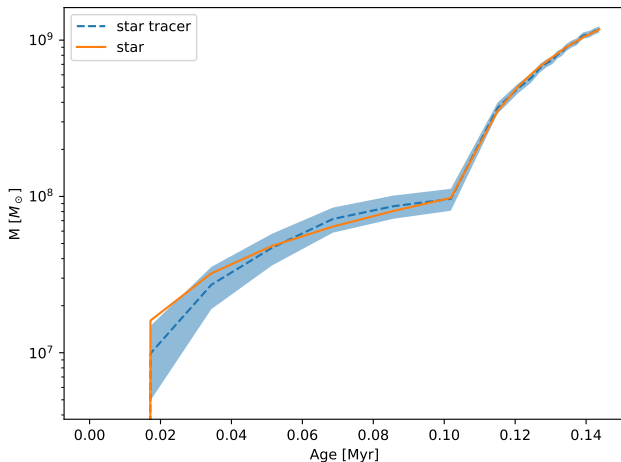

Star formation

- SF recipe: mechanical feedback
- homogeneous density

Small galaxy

Gas only

Gas and stars

Gas and star tracers

MC tracers

Discussion

TODO & wishlist:

- Get AGN feedback done (WIP).
- Other SN feedback.
- Quantify diffusion (esp. high flux limit)
- Explore other MC algorithms.

TODO & wishlist:

- Get AGN feedback done (WIP).
- Other SN feedback.
- Quantify diffusion (esp. high flux limit)
- Explore other MC algorithms.
- Get users!
