

How does the cosmic web impacts assembly bias?

Impact of large-scale structures on halo & galaxy evolution

Corentin Cadiou – PhD Student – IAP, Paris, France

Supervisors: Yohan Dubois & Christophe Pichon

In collaboration with M. Musso & C. Codis

Journe des Doctorants, March 23, 2017

Table of contents

Introduction

Effect on assembly

 Typical mass

 Effect on (DM) accretion rate

 Effect of halo formation time

 Tension with observations?

Filamentary accretion at high z

 Simple 2D setup

 Predicting the torque

Conclusions

Introduction

What's the link between galaxy/halo formation and large-scale structures?

Describing galaxies?

Theory

- + star forming?
- + bulge?
- + mass?
- + DM halo mass?
- + DM profile?
- + ...

Observations (HDF)

Describing galaxies?

Theory

- + star forming?
- + bulge?
- + mass?
- + DM halo mass?
- + DM profile?
- + ...

Observations (HDF)

And all the properties **change with cosmic time**...

Cosmic Web

Horizon-AGN simulation with skeleton, Dubois+12

And all the properties **change with cosmic time** and location w.r.t. **the cosmic web** (see .e.g K. Kraljic+2017)!

Cosmic web

- Geometry of the density/potential field
- Voids, walls, filaments, peaks (resp. 3, 2, 1, 0D)

Cosmic web

- Geometry of the density/potential field
- Voids, walls, filaments, peaks (resp. 3, 2, 1, 0D)

Cosmic web

- Geometry of the density/potential field
- Voids, walls, filaments, peaks (resp. 3, 2, 1, 0D)
or
- Critical points (0D)

Effect on assembly

Theoretical setup

Excursion set theory

Galaxy properties & evolution from **initial conditions**

⇒ Find **largest mass** that will collapse by z at **given location**

Courtesy of C. Pichon

Simulation	Theory
------------	--------

M	R
-----	-----

z, t	$\delta = \frac{\rho - \bar{\rho}}{\bar{\rho}}$
--------	---

Typical mass of DM halo

The typical mass at $z = 0$.

M. Musso, C. Cadiou et al., MNRAS

1. Larger galaxies in nodes
 2. Smaller galaxies in voids
- In agreement with n -body simulations.

Effect on (DM) accretion rate

Accretion rate at **fixed** final mass

$$M \simeq 3 \times 10^{11} M_{\odot}.$$

M. Musso, C. Cadiou *et al.*, MNRAS

1. High accretion rate in node
2. Small accretion rate in voids

Effect of halo formation time

Formation time at **fixed** final
mass $M \simeq 3 \times 10^{11} M_{\odot}$.

M. Musso, C. Cadiou *et al.*, MNRAS

1. Late formation in node (low z)
2. Early formation in voids (high z)

Effect of halo formation time

Formation time at **fixed** final mass $M \simeq 3 \times 10^{11} M_{\odot}$.

1. Late formation in node (low z)
2. Early formation in voids (high z)

Tension with observations?

Tension with observations?

Theory

Higher DM accretion + late formation:
blue central galaxy?

Observations

Massive red central galaxies

Tension with observations?

Theory

Higher DM accretion + late formation:
blue central galaxy?

Observations

Massive red central galaxies

Beyond Mass-Density

4 parameters dictate mass/accretion/formation time/...:

- mean density δ
- mean derived density

$$\delta' = \frac{d\delta}{dR}$$

Beyond Mass-Density

4 parameters dictate mass/accretion/formation time/...:

- mean density δ
- mean derived density
 $\delta' = \frac{d\delta}{dR}$
- variance of density
- variance of accretion

Beyond Mass-Density

4 parameters dictate mass/accretion/formation time/...:

- mean density δ
- mean derived density
 $\delta' = \frac{d\delta}{dR}$
- variance of density
- variance of accretion

Environments with **different variance** do not behave the same:
what matters is $(\delta - \langle \delta \rangle) / \sqrt{\text{Var}(\delta)}$

Filamentary accretion at high z

From simulations

Density maps of galaxies from New Horizon simulation @ $z = 6$, Dubois+, in prep.

Typical setup: **planar** with 3 filaments

Open questions

- **Net** torque on filaments?
- Galaxy spin-up or down?
- Typical coherence scale?

Simple 2D model

Open questions

- Net torque on filaments?
- Galaxy spin-up or down?
- Typical coherence scale?

Model

- Planar (2D)
- 3 voids \rightarrow 3 filaments
- 1 central peak

Predicting the torque

Using constrained theory + Λ -CDM power spectrum

Voids are pushing filaments

C. Cadiou, C. Pichon & S. Codis, in prep

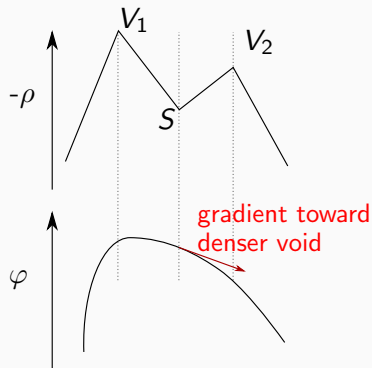

Predicting the torque

Using constrained theory + Λ -CDM power spectrum

Voids are pushing filaments

C. Cadiou, C. Pichon & S. Codis, in prep

Conclusions

Conclusions

Assembly of DM halo

- Influenced by LSS
- Recovers n -body sim
- Still need baryonic physics

Torque on filament

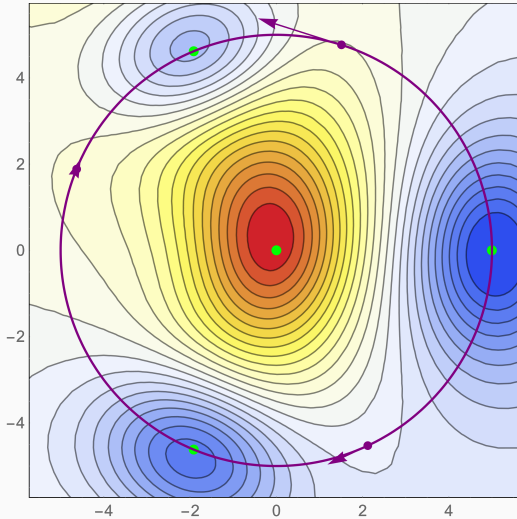

- Expect torque on filament
- Quantitative results?
- Compare with simulations?

Thank you!

More torque plots

Torque on filament

Effect of AGN
